

1. Create mysite directory

```
mkdir ~/mysite  
nano ~/mysite/index.html
```

Sample HTML:

```
<html>  
<head><title>My Site</title></head>  
<body><h1>Welcome to My Site</h1></body>  
</html>
```

```
chmod 700 ~/mysite  
chmod 600 ~/mysite/index.html
```

2. Configure Apache/Nginx

Apache:

```
Alias /mysite /home/<username>/mysite  
<Directory /home/<username>/mysite>  
    Require all granted  
</Directory>  
sudo systemctl restart apache2
```

Nginx:

```
location /mysite {  
    alias /home/<username>/mysite;  
    index index.html;  
}  
sudo systemctl restart nginx
```

Open <http://localhost/mysite>

3. Restrict another user

```
su - otheruser  
cd /home/<username>/mysite  
cat index.html
```

Result:

Permission denied

Reason:

Directory permission 700 and file permission 600 allow only the owner to access the site files.

4. Documentation

Commands used:

```
mkdir ~/mysite
```

```
chmod 700 ~/mysite
```

```
chmod 600 ~/mysite/index.html
```

```
sudo systemctl restart apache2 (or nginx)
```

Expected Output:

- Owner can access the website.
- Other user receives 'Permission denied' when attempting to access the directory or file.
- Include screenshots of the browser, terminal commands, and permission-denied message.
