

1. Check sshd status

```
sudo systemctl status sshd
```

```
# On Ubuntu: sudo systemctl status ssh
```

Record whether Active: active (running), inactive, or failed.

2. Start and stop nginx

```
sudo systemctl start nginx
```

```
sudo systemctl status nginx
```

```
sudo systemctl stop nginx
```

```
sudo systemctl status nginx
```

Observe active after start and inactive after stop.

3. Enable cron

```
Ubuntu: sudo systemctl enable cron
```

```
RHEL: sudo systemctl enable crond
```

Reboot:

```
sudo reboot
```

After reboot:

```
sudo systemctl status cron
```

4. Running services

```
systemctl list-units --type=service --state=running
```

Look for NetworkManager, networking, or systemd-networkd.

Check:

```
sudo systemctl status NetworkManager
```

5. Firewall troubleshooting

```
sudo systemctl status ufw
```

or

```
sudo systemctl status firewalld
```

If safe:

```
sudo systemctl stop ufw
```

or

```
sudo systemctl stop firewalld
```

Verify:

```
sudo systemctl status ufw
```

Document commands and results. Re-enable later if required.
